1 // CISP440 Extra Credit
2 // by Joseph Morgan
3 //
4 // Originally, this was written using classes and object-oriented design, with
5 // which I'm much more comfortable than procedural C. I decided to modify this
6 // program to compile with no warnings with the --std=c99 flag, as well as
7 // -Wall, -pedantic, etc. in order to be sure to 100% within the assignment
8 // specifications. Professor Ross mentioned at one point that he wants
9 // assignments in this class to be written in C, without using features
10 // implemented exclusively in C++. Some of the provided code for other
11 // assignments uses C++ classes (iostream and fstream, for example), but I
12 // wanted to err on the side of caution. Also, it was more fun to do something
13 // I'm less familiar with.
14 //
15 // I included some functions mostly as they were written in the last homework
16 // assignment for testing purposes.
17 //
18 // The algorithm I used is:
19 //
20 // 1. Create an empty logical matrix for the relation to be generated.
21 //
22 // 2. Create an empty logical matrix to store equiv. classes to be generated.
23 //
24 // 3. For each row r in the relation matrix,
25 //    ** TODO: It just occurred to me that to make the generated matrix more
26 //    random, r shouldn't iterate from 0 to size, but be a random row until
27 //    each row is processed... Equiv. classes seem to be weighted toward the
28 //    earlier rows. I probably won't get around to fixing that though...
29 //
30 //    a. Check each of your equiv. classes for a row with r. For example,
31 //       if you're looking at matrix[3][x], you need to add matrix[3][3] to
32 //       that row. You don't want to add the 3 if it already exists in an
33 //       equiv. class, so you scan through all classes to make sure it's not
34 //       there.
35 //
36 //       i. If an equiv. class exists with column r, copy that class to row r
37 //          of the relation matrix. Now you've got matrix[r][r] to satisfy
38 //          reflexivity, and you haven't broken transitivity by overlapping an
39 //          equiv. class.
40 //
41 //       ii. If no equiv. class exists with r, randomly generate one, being
42 //           careful to make sure you do not overlap any values already in
43 //           an equiv. class. Manually insert r value. Copy to relation matrix.
44 //
45 // I'm not sure if this is a particularly elegant solution, but I feel like
46 // I was successful in avoiding a 'guess-and-check' method.
47 //
48 // There are various command-line arguments that can be provided to influence
49 // the execution or output of generator. See the manpage for details.
50 // Just kidding.
51 //
52 // Use [-e density] to pick how densely the matrix will be populated. Should
53 // probably keep it from 0 - 10, I'm not sure what will happen if you don't.
54 //
```

```

55 // Use [-s size] to pick how many columns x rows the matrix will be. Values
56 // should be between 2 and 40.
57 //
58 // Use [-v] to make the generator output the set of relations in a list,
59 // the equiv. classes in the relation, etc. By default, the only thing that
60 // gets output is the matrix itself.
61 //
62 // With no arguments, the generator will pseudo-randomly pick a size and
63 // density. Go with this option if you like to live on the edge.
